DETAILED ACTION

Allowable Subject Matter

1. **Claims 1-7, 10, 11-14 and 16-19** are allowed.
2. The following is an examiner's statement of reasons for allowance:

Claim 1 is allowed because the closest prior art, Imajo (US Pub Number 2002/0122233) by itself or combination with Weigand (US Patent Number 6489856) fail to anticipate or teach wherein the attenuator circuit comprises a step attenuator circuit comprising: a plurality of cascaded attenuator stages, wherein each of the continuing stages comprises two resistors and a semiconductor switch in series resistors and another semiconductor switch connected to bridge one or resistors; and capacitors to separate respective input ends the attenuator stages, and input capacitor to connect an input end of the attenuator stages to an output of the optical receiver circuit, and an output capacitor to connect an output of the attenuator circuit to a load impedance.

Imajo simply discloses the optical receiving circuit includes an optical converting circuit, a sensor circuit, an attenuator circuit and based on electrical control signal from the sensor circuit, the attenuator circuit is configured to provide a constant output signal level of the optical receiving circuit. Weigand further discloses cascaded attenuation circuits and using one of the bit control signals for turning the one of the attenuation circuits.

Claim 11 is allowed because the closest prior art, Imajo (US Pub Number 2002/0122233) by itself or combination with Weigand (US Patent Number 6489856) fail to anticipate or teach a plurality of cascaded attenuator stages to selectively attenuate

an electrical signal from the optical converter circuit dependent on a characteristic value of the-an electrical power output by a sensor circuit, wherein at least one of the cascaded attenuator stages comprises: a resistor and a semiconductor switch in series with the resistor~ another resistor, wherein the resistors are connected in series: and another semiconductor switch connected in parallel with the other resistor to bridge the other resistor; and a capacitor connected between adjacent attenuator stages to separate the adjacent attenuator stages.

Imajo simply discloses the optical receiving circuit includes an optical converting circuit, a sensor circuit, an attenuator circuit and based on electrical control signal from the sensor circuit, the attenuator circuit is configured to provide a constant output signal level of the optical receiving circuit. Weigand further discloses cascaded attenuation circuits and using one of the bit control signals for turning the one of the attenuation circuits.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
